

Title: Detailed Problem Statement Definition

Project Name: AI-Powered Lead Generation System

The Problem Statement: "How might we minimize manual intervention in Salesforce lead ingestion, scoring, and distribution, while ensuring high data quality and accelerating sales pipeline velocity using Agentforce AI?"

Deep Dive into the Problem:

- **Operational Inefficiency:** Currently, sales representatives lose significant time on administrative tasks such as manual data entry and lead qualification. This manual handling creates a bottleneck, preventing the team from focusing on high-value interactions.
- **Data Quality Concerns:** Manual ingestion processes are prone to human error, resulting in duplicate records, inconsistent lead data, and missed opportunities. These inconsistencies hinder accurate reporting and pipeline forecasting.
- **Response Latency:** Without automated distribution, leads are often routed based on outdated schedules, leading to delayed follow-ups. In a competitive market, speed-to-lead is critical, and current manual workflows cannot match the responsiveness required for modern sales cycles.
- **The AI Opportunity:** By implementing **Agentforce AI**, we move from a reactive, human-dependent model to a proactive, automated one where the AI handles initial prospect engagement, scoring leads in real-time, and ensuring only the most viable prospects reach the sales team.
