

Solution Requirements

This defines the technical and functional expectations for the project.

- **Functional Requirement - Automated Ingestion:** The system must support zero-touch lead creation where the [Agentforce AI](#) creates a Lead record only after mandatory data fields are satisfied, effectively gatekeeping poor-quality leads from entering the pipeline.
- **Functional Requirement - Dynamic Prioritization:** The system must maintain a lead-scoring model that updates in real-time as leads interact with the system, automatically promoting or demoting leads based on intent signals.
- **System Requirement - Robust Scalability:** The solution must be built using declarative Salesforce tools (Flows, Object Schema) to ensure the system can scale as lead volume increases, without requiring custom code maintenance.
- **Data Quality Assurance:** Implementation of declarative validation rules must occur at the object level to ensure that all data imported via [Data Loader](#) conforms to the corporate data standard, effectively mitigating the risk of database pollution
