

Data Model Design

This explains how your data is structured to support the system's logic.

- **Custom Objects & Fields:** Beyond standard lead fields, the system includes custom fields such as `AI_Engagement_Score__c` (Numeric), `Interaction_Summary__c` (Long Text Area), and `Lead_Intent_Category__c` (Picklist).
- **Schema Mapping:** As seen in your [data migration](#) documentation, the model follows a strict 1:1 mapping between incoming lead data sources and Salesforce objects. This eliminates data mapping errors and ensures that validation rules trigger correctly at the point of ingestion.
- **Relational Logic:** The design ensures that every Lead is linked to an account placeholder and a contact record, maintaining 360-degree visibility. This structure is optimized for reporting, allowing managers to query lead conversion rates based on the `AI_Engagement_Score__c`.
