

Project Development: Technical Implementation

The development of the **AI-Powered Lead Generation System** was executed in four key workstreams to ensure a seamless integration of AI-driven lead management within the [Salesforce Lightning Experience](#).

1. AI Orchestration (Agentforce Configuration):

- Configured the [Agentforce AI Assistant](#) using declarative agents and dialog definitions.
- Defined interaction parameters to ensure the AI proactively captures essential lead data (Industry, Budget, Intent) during the initial conversational phase, providing a frictionless experience for prospects.

2. Automation & Logic Build (Salesforce Flow):

- Developed complex [Salesforce Flow Builder](#) automations that govern the backend lifecycle of a lead.
- Implemented "Lead Scoring" triggers that calculate engagement scores based on input variables, and "Dynamic Routing" flows that automatically assign qualified leads to the appropriate sales queues.

3. Data Schema & Integrity Build:

- Configured the [Custom Lead/Opportunity objects](#) to include specific fields for AI data, such as `AI_Engagement_Score__c` and `Interaction_Summary__c`.
- Established validation rules to ensure data consistency during [data migration](#) processes, preventing duplicates and ensuring all ingested data meets organizational quality standards.

4. Integration & Version Control:

- Synchronized all configurations within the [force-app/main/default/](#) directory, enabling robust version control.
- Finalized the [architecture-diagram.png](#) to serve as the master technical blueprint for the system, ensuring that all components—from the AI bot to the flow-based alerts—are logically mapped for future maintenance.
