

System Architecture Design

This section outlines the high-level technical structure of your [AI-Powered Lead Generation System](#).

- **Overview:** The architecture follows a modular approach within the [Salesforce Lightning Experience](#) platform. It leverages [Agentforce AI](#) for the conversational interface, which acts as the intelligent front-end for data ingestion.
- **Data Tier:** At the core, we utilize the standard Salesforce Lead and Opportunity objects, extended with custom fields to support AI-driven metadata (e.g., Lead Score, AI-Interaction Summary).
- **Logic Tier:** Centralized around [Salesforce Flow Builder](#). This layer decouples the business logic from the user interface, ensuring that lead scoring, routing, and notifications operate asynchronously without impacting the AI assistant's performance.
- **Security Model:** The design incorporates a role-based access control (RBAC) hierarchy, ensuring that lead data is only visible to authorized sales personnel based on their assigned region or team, adhering to the principle of least privilege.
