

User Interface (UI) Design

This defines how the user interacts with the system, both for the prospect and the sales rep.

- **Prospect Interaction (Front-End):** The [Agentforce AI Assistant](#) is designed as a minimalist, conversational chat interface. It utilizes structured dialog flows to guide the prospect through data entry, ensuring a clean, friction-less experience that prioritizes user engagement.
- **Sales Representative Dashboard (Back-End):** The interface is designed within the Salesforce Lightning App Builder. It features a "Lead Command Center" component that displays:
 - **Hot Lead Alerts:** A real-time notification feed powered by Flow automation.
 - **AI Interaction Summary:** A dedicated tab within the Lead record that parses the conversational logs from the AI, allowing the sales rep to view the context immediately upon opening the record.
 - **Prioritization Grid:** A visual Kanban view of leads, color-coded by their AI-assigned intent score.
