

Customer Journey Analysis

This section maps the lifecycle of a lead interacting with the AI-Powered system.

- **Awareness & AI-Driven Acquisition:** The journey begins when a prospect initiates contact through your digital channels. Instead of a static form, they are engaged by the [Agentforce AI Assistant](#), which proactively greets them. The AI performs real-time conversational qualification, ensuring that by the time a lead is created in Salesforce, it already contains critical parameters like company size, industry, and budget. This eliminates the "cold lead" phase where reps typically waste hours trying to reach unresponsive prospects.
- **Data Ingestion & Integrity:** Once the AI session concludes, the [data migration](#) process triggers. The system automatically populates the Lead object, performing validation to check for duplicates or missing information. This ensures that the CRM data remains clean and actionable from the moment of ingestion.
- **Intelligent Scoring & Routing:** After ingestion, the system triggers custom Salesforce Flows. These Flows analyze the engagement data collected by the AI and assign a numeric "Actionable Score." High-intent leads (e.g., those who asked specific product questions or requested a demo) are automatically moved to the "Hot" queue.
- **Sales Representative Handover:** The representative receives a real-time notification containing a summary of the prospect's entire AI conversation. This allows the sales rep to skip the "discovery" phase and immediately move to value-driven selling, significantly increasing conversion rates and reducing lead-to-opportunity time.
