

Process/Flow Design

This documents the automated workflows that power the system.

- **Lead Ingestion Flow:** Triggered upon the completion of an AI session, this flow handles the automated creation of the lead record. It includes a "Data Sanitization" step to normalize phone numbers and email formats before record commit.
- **Scoring & Routing Flow:** A secondary flow that runs every time a lead score is updated. It evaluates the score against business-defined thresholds (e.g., Score > 80 = "Hot") and utilizes the "Assignment Rule" engine to push the lead to the correct sales queue.
- **Notification Flow:** An automated trigger that fires upon successful routing, sending an email or push notification to the sales representative's Salesforce mobile app, providing them with a direct link to the lead record.
