

Technical Documentation (System Maintenance Guide)

This document serves as the "source of truth" for future developers or administrators managing your system.

- **System Overview:** The system is an automated lead-to-sales pipeline built on [Salesforce Lightning Experience](#). It integrates [Agentforce AI](#) for prospect interaction and custom [Salesforce Flows](#) for business logic.
- **Configuration Inventory:**
 - **Agentforce Agents:** Configured with specific dialog flows to gather Prospect Name, Email, Industry, and Budget.
 - **Custom Objects:** Includes `AI_Engagement_Score__c` and `Interaction_Summary__c` for tracking lead performance.
 - **Automation Logic:** Detailed in the `force-app/main/default/flows/` directory, these flows handle automated lead routing based on scoring thresholds (e.g., `Score > 80` triggers High-Intent routing).
- **Maintenance Procedures:**
 - **Flow Updates:** Any changes to routing logic should be tested in a Sandbox environment before deployment.
 - **AI Tuning:** Periodically review Agentforce logs to ensure prospect queries are being handled accurately; adjust dialog training as needed.
- **Version Control:** All configuration changes, code, and documentation are tracked and maintained in the [GitHub Repository](#).
